

## Java EE

- We are going to create a dynamic Java Web application;
- Download Apache Tomcat and Eclipse Java EE Developers. Unzip the files;
- Configure Tomcat for Eclipse:
  - (a) ctrl + 3, search for Servers;
  - (b) right click over the tab Servers, select New -> Server;
  - (c) select Apache Tomcat 6.0 and choose the folder for Tomcat;
  - (d) start the server;
- Create a new application in Eclipse, by choosing New -> Project -> Dynamic Web Project;
- Right click over the tab Servers, select Add and add the project to the Tomcat server;
- To visualize the application, you can choose between:
  - (a) open the browser in [http://localhost:8080/nome\\_do\\_projeto](http://localhost:8080/nome_do_projeto)
  - (b) right click over the project (it has to be a "Dynamic Web project" type), choose "Run As" and then "Run On Server". Select the server "Tomcat v6.0 Server at localhost" and click "Finish".
- **Tip:** don't forget to restart the server for the modifications to be updated in the browser.
